HAI LOGISTIC

CORPORATE WEBSITE & MULTI-BRAND E-COMMERCE PLATFORM

GOOGLE AI STUDIO – MASTER DEVELOPMENT PROMPT

HAI Logistic • Rivora • Ran Diriya

PROJECT TYPE	Corporate group website with two integrated e-commerce stores
DEVELOPMENT PLATFORM	Google AI Studio Build Mode
MAIN BUSINESS	HAI Logistic – logistics and corporate enquiries
BRAND STORES	Rivora – flowers, gifts and café; Ran Diriya – Sri Lankan spices and tea
DOCUMENT	Detailed implementation brief and copy-ready master prompt

PROJECT OBJECTIVE

Create one unified digital platform with three distinct business identities. HAI Logistic is the parent corporate presence; Rivora and Ran Diriya operate as separate branded shopping experiences with independent catalogues, carts, orders and administration.

HOW TO USE THIS DOCUMENT

Copy the master prompt in this document into Google AI Studio Build Mode. Provide the three original logos and approved business content when requested. Ask the AI to complete the implementation in stages and verify each stage before moving forward.

Important: This document is a development specification. Production launch still requires real business content, product data, payment merchant approval, shipping rules, security testing and deployment configuration.

MASTER DEVELOPMENT PROMPT

Copy the following project instructions into Google AI Studio Build Mode.

1. PROJECT OVERVIEW

Act as a senior full-stack software architect, UI/UX designer, e-commerce developer, database architect and digital branding specialist.

Design and develop a premium, modern, responsive, full-stack corporate website and multi-brand e-commerce platform for HAI Logistic, a Sri Lankan parent company operating three businesses:

1. HAI Logistic – Main corporate logistics business.
2. Rivora – Flowers, gifts and café business.
3. Ran Diriya – Sri Lankan spices, Ceylon tea and related products.

Create one unified digital platform with three distinct business identities. Do not build a simple static presentation website. Build a functional application with a real database, backend, administration dashboard and e-commerce functionality.

2. TECHNOLOGY STACK

Use Google AI Studio Build Mode with React and TypeScript for the frontend, Node.js server-side backend, Firebase Authentication, Cloud Firestore, Firebase Storage, secure server-side API endpoints and Google Cloud Run deployment. Integrate GitHub for source-code management.

Use reusable components and a modular architecture. Keep payment credentials, API secrets and sensitive operations strictly on the server.

3. BRAND ARCHITECTURE

Parent company: HAI Logistic. Business 01: HAI Logistic – corporate logistics operations. Business 02: Rivora – flowers, gifts and café. Business 03: Ran Diriya – Sri Lankan spices and tea.

Each business must have its own landing page, navigation and content, product catalogue where applicable, independent inventory, separate shopping cart, separate orders, customer order history, contact details and reporting.

Use a businessId as the primary data-separation mechanism. Never mix Rivora products or orders with Ran Diriya products or orders.

4. WEBSITE URL STRUCTURE

Use one main domain initially, subject to availability. Recommended routes:
/
/about-us/
/logistics/
/businesses/
/rivora/
/rivora/shop/
/rivora/product/
/rivora/cart/
/rivora/checkout/
/rivora/account/
/ran-diriya/
/ran-diriya/shop/
/ran-diriya/product/
/ran-diriya/cart/
/ran-diriya/checkout/
/ran-diriya/account/
/contact/

Use clean, SEO-friendly URLs. Keep the architecture flexible enough to support separate brand domains in the future.

5. DESIGN AND BRANDING DIRECTION

The client already has three existing logos. Use the supplied original logo files. Do not redesign, modify, recolour, distort or replace the logos.

HAI Logistic: professional corporate design; proposed navy blue, white and orange palette; strong typography; high-quality logistics and cargo imagery; modern corporate layouts.

Rivora: elegant lifestyle design; proposed soft cream, botanical green and warm neutral colours; beautiful floral imagery; premium gifting presentation; attractive café experience; refined typography and spacious layouts.

Ran Diriya: authentic Sri Lankan identity; proposed deep green, earthy brown and gold; premium tea and spice photography; natural textures; product-origin storytelling; international retail and export-oriented appearance.

Treat these colours as initial design directions only. Match the final system to the supplied brand assets. Do not apply one identical visual theme to all three brands.

6. CORPORATE WEBSITE – HAI LOGISTIC

HOME: large professional hero section, company introduction, logistics business overview, business portfolio, introduction to Rivora and Ran Diriya, corporate credibility section and business enquiry call to action.

ABOUT US: company background, company story, vision and mission, corporate values, management introduction and achievements.

LOGISTICS: confirmed logistics service categories, service descriptions, operational capabilities, logistics process, corporate enquiry form and Request a Quotation button.

CONTACT: company contact information, contact form, business location, telephone and email links, and map integration when location details are supplied.

Only publish logistics services that HAI Logistic actually provides. Do not invent freight, transport, warehousing, distribution or other capabilities.

7. RIVORA E-COMMERCE STORE

Build a complete online shopping experience for flowers, gifts and café products.

Suggested categories: Flower Bouquets, Premium Flowers, Gift Collections, Birthday Gifts, Anniversary Gifts, Special Occasion Gifts, Customized Gifts, Café Products and Menu. Make all categories editable in the admin dashboard.

Product details must support name, description, multiple images, price, discounted price, variants, stock availability, SKU, delivery availability, greeting-card message and customer personalization options.

Special features: flower arrangement options; gift size or variant selection; personalized greeting card messages; requested delivery date where supported; delivery instructions; recipient details; WhatsApp assistance.

Shopping features: add to cart, update quantity, remove products, calculate totals, checkout, customer registration, optional guest checkout, order confirmation and order tracking.

Café: dedicated café landing section, menu categories, food and beverage products, descriptions, images, pricing and availability management. Enable online café ordering only if the client confirms it is supported.

8. RAN DIRIYA E-COMMERCE STORE

Build a premium Sri Lankan product shopping experience.

Suggested categories: Ceylon Black Tea, Ceylon Green Tea, Premium Tea Collections, Cinnamon, Black Pepper, Cardamom, Cloves, Other Sri Lankan Spices, Spice Gift Collections and Export/Wholesale Products.

Product details must support name, description, photographs, ingredients, verified product origin, weight and packaging options, price, SKU, stock quantity, variants and storage information where applicable.

Special features: weight and packaging selection, multiple quantity purchases, bulk ordering, wholesale enquiries, international enquiries, product-origin storytelling and gift collections.

Provide dedicated wholesale and export enquiry forms. Do not invent certifications, quality standards, export approvals, organic claims or product-origin details. Use only information supplied and verified by the client.

9. COMPLETE E-COMMERCE FUNCTIONALITY

Develop a reusable but business-separated e-commerce engine.

Customer features: registration, login/logout, profile management, saved delivery addresses, order history, order tracking, shopping cart and checkout.

Create an independent cart for each business. Support product quantity updates, variant selection, subtotal, delivery charges, discounts and final payable amount. Do not allow products from different business stores to be combined into one checkout.

Checkout fields: customer name, email, telephone, delivery address, city, delivery instructions, delivery option, payment method and order summary.

Order statuses: Pending, Awaiting Payment, Payment Confirmed, Processing, Ready for Dispatch, Dispatched, Delivered, Cancelled and Refunded. Only authorized staff may change order status.

10. PAYMENT INTEGRATION

Create a secure, modular payment integration architecture. Prepare support for PayHere or another client-approved Sri Lankan payment gateway, Cash on Delivery if enabled, and bank transfer if enabled.

Generate payment requests through secure backend endpoints. Never expose merchant secrets in frontend code. Verify server-side payment notifications, validate checksums or signatures, prevent duplicate payment processing, store payment references, maintain transaction history and update orders only after verified payment confirmation.

Support failed and cancelled payments and provide payment reconciliation tools. Use sandbox/test mode initially. Do not activate live payments without approved merchant credentials and successful end-to-end testing.

11. DELIVERY MANAGEMENT

Create configurable delivery management for each business. Admin must be able to configure delivery zones, delivery fees, free-delivery thresholds, delivery options, delivery availability, delivery status and tracking references.

For Rivora, support scheduled gift delivery where the business offers it. For Ran Diriya, support domestic and international shipping configurations. Do not invent shipping rates, delivery promises or international service availability.

12. CENTRAL ADMINISTRATION DASHBOARD

Build a professional, secure administration dashboard.

Main dashboard: total orders, total sales, pending orders, completed orders, sales by business, recent orders, product performance, inventory alerts and enquiry summaries.

HAI Logistic workspace: corporate enquiries, quotation requests, contact submissions and lead management.

Rivora workspace: product management, category management, inventory management, order management, customer management, delivery management and café menu management.

Ran Diriya workspace: product management, category management, inventory management, order management, customer management, wholesale enquiries and export enquiries.

General administration: customer records, payment records, reports, discounts, coupons, delivery settings, website content, media management, user management, business settings and audit logs.

13. USER ROLES AND SECURITY

Create role-based access control.

Super Admin: full access to all businesses. Logistics Manager: HAI Logistic enquiries and corporate content. Rivora Manager: Rivora operations only. Ran Diriya Manager: Ran Diriya operations only. Order Staff: assigned order processing tasks only.

Implement secure authentication, server-side authorization, Firestore security rules, business-level data isolation, input validation, protection against unauthorized access, rate limiting for sensitive endpoints, secure password handling through Firebase Authentication and audit logs for administrative changes.

Do not rely on hiding dashboard buttons as a security measure. Enforce all permissions in the backend and database rules.

14. DATABASE ARCHITECTURE

Create structured Firestore collections: businesses, users, roles, customers, products, categories, product_variants, inventory, carts, orders, payments, deliveries, enquiries, quotations, coupons, reviews, website_content, notifications, audit_logs and settings.

Every relevant business record must contain businessId, createdAt and updatedAt. Use server-side timestamps. Create appropriate indexes and validation rules. Ensure all queries respect business-level access permissions.

15. NOTIFICATIONS

Prepare notification functionality for new customer orders, successful payments, failed payments, order status changes, new corporate enquiries, new wholesale enquiries and inventory alerts.

Use configurable email notification services. Include WhatsApp contact links for customer assistance. Do not claim automatic WhatsApp message delivery unless an approved WhatsApp API integration is configured.

16. REPORTING AND ANALYTICS

Create separate and combined business reports.

HAI: corporate enquiry volume, quotation requests and lead status. Rivora: sales, orders, popular products, inventory and revenue trends. Ran Diriya: sales, orders, product performance, wholesale enquiries and domestic/international orders.

Allow date filters and CSV export. Show separate business performance and combined group-level reporting.

17. SEO AND DIGITAL MARKETING

Implement SEO-friendly page titles, meta descriptions, clean URL structures, XML sitemap, robots.txt, Open Graph metadata, product structured data, organization structured data, canonical URLs, image optimization, fast page loading, Google Analytics integration and Google Search Console readiness.

Each brand must have independent SEO content and metadata.

18. RESPONSIVE DESIGN

Develop mobile-first responsive interfaces for desktop, laptop, tablet, Android mobile and iPhone.

Use modern typography, consistent spacing, professional navigation, high-quality imagery, clear calls to action, accessible colour contrast, restrained animations, proper loading states, empty states, error messages and success notifications. Avoid cluttered layouts and excessive animation.

19. DEVELOPMENT QUALITY REQUIREMENTS

The application must be functional, not merely visually complete.

Do not use fake checkout success messages, store orders only in browser local storage, hard-code sample products as permanent production data, expose API keys, invent payment confirmations, use insecure database rules, mix the two stores' orders or display imaginary business details.

Use sample data only for clearly labelled development demonstrations. Implement proper error handling and loading states. Create reusable components and maintainable code.

20. TESTING REQUIREMENTS

Before production deployment, test all website routes, mobile navigation, user authentication, admin access permissions, product creation and editing, inventory updates, separate business catalogues, cart calculations, checkout validation, duplicate order prevention, payment verification, order status management, delivery calculations, data security, responsive behaviour and SEO metadata.

Create automated tests for important checkout, authorization and business-isolation logic.

21. IMPLEMENTATION INSTRUCTIONS

Do not attempt to build every feature in one unverified operation. Follow this sequence:

STAGE 1: Analyze requirements and create the complete application architecture, sitemap, database schema and UI design system.

STAGE 2: Build the HAI corporate website and the two separate brand landing pages.

STAGE 3: Implement Firebase database, authentication, storage and secure backend.

STAGE 4: Build Rivora e-commerce functionality.

STAGE 5: Build Ran Diriya e-commerce functionality.

STAGE 6: Build the central administration dashboard and role-based access.

STAGE 7: Integrate payment, delivery and notification systems.

STAGE 8: Test, debug, optimize and prepare production deployment.

After completing each stage, run the application, check all affected pages, verify functionality, fix errors before proceeding and preserve completed work.

22. FINAL DESIGN EXPECTATION

The final website should look like a professionally developed Sri Lankan corporate group website with two premium commercial brands.

HAI Logistic must establish corporate credibility. Rivora must deliver an elegant gifting and café shopping experience. Ran Diriya must communicate authentic Sri Lankan products with a premium retail and export-oriented identity.

All three businesses must be easy to navigate, manage and expand. The final application must be scalable, secure, responsive and ready for a structured production-readiness review.

Start by presenting the architecture and creating the first development stage. Do not fabricate missing company information. Use clearly marked placeholders until actual company details, approved logos, product data, prices, photographs, contact details and payment credentials are supplied.

END OF MASTER PROMPT
